

The Eliminator One and Two Installation Guide:

- 1) Cut Main water line where you want to install the system.
- 2) Install male adapters and unions on both sides of the housing, so if you have to replace the housing for any reason you will not have to do any re plumbing.
- 3) Install a shut off valve before the Eliminator system so you can easily change the filters when needed.
- 4) Install a "t" with a faucet attached to it on the discharge side of the Eliminator system. This is used to bleed the air off the system and to run the water until it runs clear, it is also great for attaching a hose to for washing cars and windows with.
- 5) Use mounting brackets and mount system against a wall.
